

GOLF CLUB PUTTER

ABSTRACT OF THE DISCLOSURE

A golf club putter having a centerline that when extended through the length of the putter extends through the shaft and the hosel. The putter is configured such that at about when the putter head at a desired contact point disposed thereon contacts a golf ball, the centerline extends through to about a point of tangency of the golf ball and a surface where the golf ball is disposed. With this alignment, the putter greatly reduces or completely obviates the need to weight any one end of the putter head to compensate for an application of torque.
